ABSTRACT: *Anadara (Anadara) subrubra* (Dunker, 1866), a little-known anadarine species, has been recently reinstated as a valid species distributed in the Philippines, South China Sea to southern Japan. Its re-description, illustrations of type material, synonymy and comparison with allied species are presented. *A. subrubra* was often misidentified as *Anadara antiquata* (Linnaeus, 1758); a synonym of the former species is *Anadara dekkeri* Thach, 2015 described from Vietnam. Comments on taxonomy and identities of taxa included into the *A. antiquata* species complex are given.

Keywords: Arcidae, Anadarinae, *Anadara antiquata* (Linnaeus, 1758) complex, *Anadara subrubra* (Dunker, 1866) identity, taxonomy, type material, re-description
